

Internationale Möbelmesse Köln 2020

### **Lucellino x Sense System** **Homage to the fascinating flight of birds**

For his showroom in the Design Post Cologne, Buschfeld presented another product fusion with Ingo Maurer at the imm Cologne 2020: For the first time, Lucellino luminaires, whose handmade white feather wings are reminiscent of a bird, are combined with the thin tracks of the smart Sense System made possible by a specially manufactured Buschfeld adapter hidden in the track.

#### Charming flying optics

The white track setup in the Design Post swings like the paths of a bird's flight sometimes in small, sometimes in larger curves or in a straight route elegantly and easily through the space in the gallery of the arched hall.

This route is based on a further special feature: the seamless joining of shorter track sections with large and small radii creates the charming dynamics that reproduce the lines of a bird's flight. In addition, the orientation of the rail profile changes again and again: sometimes it points downwards, then sideways to the left, sideways to the right or upwards. This allows the graceful Lucellino luminaires to be inserted into the track in different ways, making them visible from a new perspective again and again and creating the joyful dynamics of a bird's flight.

#### Unique, scalable light objects

This bird flight is available as a predefined track ensemble, as presented in the Design Post. The new cooperation with Ingo Maurer also makes it possible to implement tailor made and project related solutions for the bird flight. Individual and unique compositions are possible to stage rooms with precise lighting: Longer flight routes, more dynamic flight routes, aligned for example with spacious architecture. Moreover, extraordinary spatial requirements can be realised.

#### Smart, functional light poetry

In the installation for the imm Cologne, individual Lucellino luminaires "float" on the tracks of the Sense System. It's also possible to increase the number of Lucellos and choreograph their positioning individually - for example, by having them move closer together, like the flight of a whole flock of birds - adapted to the possibilities offered by the particular room. The Lucellino luminaires create an atmospheric light. In order to meet the need for functional lighting in this setting, the minimalist Sense System spots can of course be supplemented, for example, for spot illumination and optimum lighting comfort.

**buschfeld**

imm cologne 2020/ Design Post Köln

Thanks to the interaction with the smart Buschfeld Sense System, the Lucellino luminaires by Ingo Maurer can be individually controlled, even the most diverse lighting scenes can be depicted. With this scalable lighting concept, further optlighting scenes can be depicted. With this scalable lighting concept, further options for customized lighting design are created to meet the most diverse requirements.
